

Session 3: Wiselib Architecture

Wiselib Programming Basics: Embedded C++ and Templates

Tobias Baumgartner

Braunschweig Institute of Technology

October 13th, 2009

Outline

- 1 Basic Design Issues
 - Why is template based design so great?
 - Wiselib Basics
- 2 Architecture
 - OS Facets
 - Example Usage of Os Facets
 - Internal Interface
 - Message Delivery
- 3 Algorithms
- 4 Wiselib Distribution
- 5 Exercises

 - OS Facets
 - Example Usage of Os Facets
 - Internal Interface
 - Message Delivery
- 3 Algorithms
- 4 Wiselib Distribution
- 5 Exercises

Having Virtual Methods

```
1 #include <stdio.h>
2
3 class BaseClass
4 {
5 public:
6     virtual int value()
7     { return 34; }
8 };
9
10 class StaticTestClass
11 {
12 public:
13     static int value( BaseClass *mc )
14     { return mc->value(); }
15 };
16
17 int main()
18 {
19     BaseClass mc;
20     int i = StaticTestClass::value( &mc );
21     printf( "Values: %d\n", i );
22 }
```

Having Templates

```
1 #include <stdio.h>
2
3 class BaseClass
4 {
5 public:
6     int value()
7     { return 34; };
8 };
9
10 template<typename Class>
11 class StaticTestClass
12 {
13 public:
14     static int value( Class *mc )
15     { return mc->value(); }
16 };
17
18 int main()
19 {
20     BaseClass mc;
21     int i = StaticTestClass<BaseClass >::value( &mc );
22     printf( "Values: %d\n", i );
23 }
```

Let's Compile!

- Virtual Method

```

1 #####
2 # Virtual
3 #####
4 ba-elf-g++ -g -Os -c virtual.cpp -o virtual.o
5 ba-elf-size virtual.o
6     text      data      bss      dec      hex filename
7     151        0        0       151      97 virtual.o

```

- Using the template approach

```

1 #####
2 # Template
3 #####
4 ba-elf-g++ -g -Os -c template.cpp -o template.o
5 ba-elf-size template.o
6     text      data      bss      dec      hex filename
7     52         0        0       52      34 template.o

```

5 Exercises

Template Based Design

```
1  class iSenseRadioModel {  
2      void foo( int param );  
3  }
```

```
4  
5  class ShawnRadioModel {  
6      void foo( int param );  
7  }
```

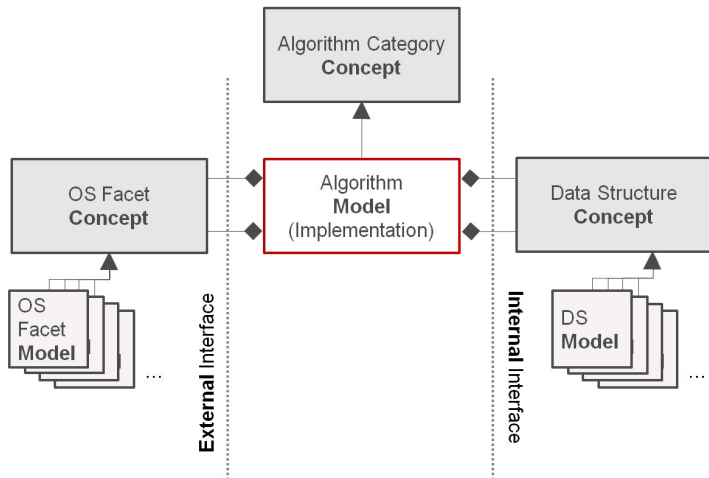

```
8  template<typename Radio>  
9  class Algorithm {  
10     void bar()  
11     { radio_.foo( 55 ); }  
12  
13     Radio radio_;  
14 }
```

```
15 Algorithm<iSenseRadioModel> algorithm_isense_;  
16 Algorithm<ShawnRadioModel> algorithm_shawn_;
```

Structure

- Basic design idea: **Concepts and Models**
- **Concepts** (*e.g., Radio*)
 - Documentation of a class
 - **No** written source code
 - List member functions and provided types
 - Interface description
- **Models** (*e.g., iSenseRadioModel*)
 - Implementation of a model
 - Must implement each listed member function and type
 - There can be multiple models per concept
 - One model can implement multiple concepts
- **Usage** (*e.g., Algorithm*)
 - Model is expected as template parameter
 - In implementation, rely on concept description
 - Compiler can resolve everything at compile-time

Overview

Facets

Models

◀ ▶ ↻ 🔍

Structure

- **Connection** between Algorithms and OS
- **OS Facets**
 - Os Facet
 - Radio Facet
 - Timer Facet
 - ...
- For **each** supported OS at least **one model** per **facet**
 - iSenseOsModel
 - ContikiRadioModel
 - ...
- Possible to provide multiple models per facet
- Specifics due to underlying Os: C, nesC, C++
 - Callback registration (C functions vs. Member functions)
 - We **do not** want to have instances of any Os Facet Model

Os Facet Details

- **Static Member Functions**

```
1      concept Radio {  
2          ...  
3          static inline void enable( Os *os );  
4          ...  
5      }
```

- **OS Pointer** contains information about the underlying Os

- In iSense it is `isense::Os`
- In Shawn it is the corresponding `shawn::Processor`
- In Contiki it is just `void`

```
1      static inline void enable( Os *os )  
2      {  
3          os->radio().enable();  
4      }
```

Example: Radio Concept

```
1 concept Radio {
2     typedef ... OsModel;
3     typedef ... Os;
4     typedef ... node_id_t;
5     typedef ... data_t;
6     typedef ... size_t;
7     typedef ... message_id_t;
8
9     enum SpecialNodeIds { BROADCAST_ADDRESS=..., NULL_NODE_ID=... };
10    enum Restrictions { MAX_MESSAGE_LENGTH = ... };
11
12    static inline int
13    send(Os *os, node_id_t id, size_t len, const data_t *data);
14
15    static int enable( Os *os );
16    static int disable( Os *os );
17    static node_id_t id( Os *os );
18
19    template<class T, void (T::*TMethod)(node_id_t, size_t, data_t*)>
20    static int reg_rcv_callback( Os *os, T *obj_pnt );
21    static void unreg_rcv_callback( Os *os, int idx );
22};
```

Example: Use Radio in Algorithm

```
1 template <...,  
2     typename Radio_P ,  
3     ... >  
4 class MyAlgorithm  
5 {  
6     typedef typename Radio_P Radio ;  
7     ...  
8     foo( void ) ;  
9     ...  
10 }  
11 // _____  
12 template <...,  
13     typename Radio_P ,  
14     ... >  
15 void  
16 MyAlgorithm <..., Radio_P , ... >::  
17 foo( void )  
18 {  
19     ...  
20     Radio::enable( os() ) ;  
21     ...  
22 }
```

Outline

- 1 Basic Design Issues
 - Why is template based design so great?
 - Wiselib Basics
- 2 **Architecture**
 - OS Facets
 - Example Usage of Os Facets**
 - Internal Interface
 - Message Delivery
- 3 Algorithms
- 4 Wiselib Distribution
- 5 Exercises

Example: Radio Usage

- Enable/Disable

```
1| Radio::enable( os() );  
2| Radio::disable( os() );
```

- Sending a message

```
1| char message[] = "Hello World!";  
2| Radio::node_id_t dest = Radio::BROADCAST_ADDRESS;  
3| Radio::send( os(), dest, sizeof(msg), (block_data_t*)msg );
```

- Register receive method (within a template)

```
1| Radio::template reg_rcv_callback<MyClass, &MyClass::receive>  
2|    ( os(), this );  
3| ...  
4| template <...>  
5| void MyClass<...>::receive( node_id_t, size_t, block_data_t )  
6| { ... }
```

Note that the name of the method (here: `receive`) does **not** matter! Only the signature must be correct. Hence you could register different methods at different radios, for example.

Example: Timer Usage

- Set timer within a template

```
1 | Timer::template set_timer<MyClass, &MyClass::timer_elapsed>(
2 |                               os(), time_in_ms, this, userdata );
3 | ...
4 | template <...>
5 | void MyClass<...>::timer_elapsed( void *userdata )
6 | { ... }
```

- Set timer outside a template

```
1 | Timer::set_timer<MyClass, &MyClass::timer_elapsed>(
2 |                               os(), time_in_ms, this, userdata );
3 | ...
4 | void MyClass<...>::timer_elapsed( void *userdata )
5 | { ... }
```

Outline

 - Example Usage of Os Facets
 - Internal Interface**
 - Message Delivery
- 3 Algorithms
- 4 Wiselib Distribution
- 5 Exercises

Structure

- Data structures used by algorithms
 - Various implementations for different demands
 - Static vs Dynamic
- pSTL: picoSTL for static containers
 - Iterator
 - Vector
 - List
 - Priority Queue
 - Pair
 - ...

Outline

- 1 Basic Design Issues
 - Why is template based design so great?

- 3 Algorithms
- 4 Wiselib Distribution
- 5 Exercises

Problems in Heterogeneous Systems

1. Bit Width

2. Byte Order

3. Alignment

Serialization

- Templated Serialization provided by Wiselib

```
1 template<typename OsModel_P, typename Data_P, typename Type_P>
2 inline Type_P read( Data_P *target )
3 {
4     return Serialization<OsModel_P, Data_P, Type_P>::
5         read( target );
6 }
7
8 template<typename OsModel_P, typename Data_P, typename Type_P>
9 inline typename OsModel_P::size_t write(Data_P *target,
10                                     Type_P& value)
11 {
12     return Serialization<OsModel_P, BlockData_P, Type_P>::
13         write( target, value );
14 }
```

General Approach

- Provide basic implementation

```
1 template<typename OsModel_P, typename Data_P, typename Type_P>
2 class Serialization
3 {
4     public:
5         typedef OsModel_P OsModel;
6         typedef Data_P BlockData;
7         typedef Type_P Type;
8
9         typedef typename OsModel::size_t size_t;
10        // _____
11        static inline size_t write( BlockData *target, Type& value )
12        {
13            *((Type*)target) = value;
14            return sizeof(Type);
15        }
16        ...
```

Spezialization

- Specialize for Platforms or Types

```
1 template<typename OsModel_P, typename BlockData_P>
2 class Serialization<OsModel_P, BlockData_P, uint16_t>
3 {
4     public :
5         typedef OsModel_P OsModel;
6         typedef BlockData_P BlockData;
7         typedef uint16_t Type;
8
9         typedef typename OsModel::size_t size_t;
10        // -----
11        static inline size_t write( BlockData *target, Type& value )
12        {
13            *target = (value >> 8) & 0xff;
14            *(target + 1) = value & 0xff;
15            return sizeof(uint16_t);
16        }
17        ...
```

Result

- Can be specialized for **each system** and **each data type**
- Data Access in Messages

```
1 | inline uint8_t msg_id()  
2 | { return read<OsModel, uint8_t>(buffer); }  
3 |  
4 | inline void set_msg_id( uint8_t id )  
5 | { write<OsModel, block_data_t, uint8_t>(buffer, id); }
```

Outline

- 1 Basic Design Issues
 - Why is template based design so great?
 - Wiselib Basics
- 2 Architecture
 - OS Facets
 - Example Usage of Os Facets
 - Internal Interface
 - Message Delivery
- 3 Algorithms
- 4 Wiselib Distribution
- 5 Exercises

Overview

- Heart of Wiselib
- Provide different algorithm categories
 - Routing
 - Crypto
 - Clustering
 - Localization
 - ...
- One **Concept** for each category
- Multiple implementations (**models**) per concept
 - DsdvRouting
 - HeedClustering
 - ...

Advantages and Special Design Issues

- Stackability
 - Stack one algorithm into another
 - E.g., easily combine Crypto with Routing to get Secure Routing
- Interchangeability
 - Exchange one algorithm within a second or two
 - E.g., change typedefs to use AODV instead of DSDV
- Cross-Layer Design
 - One model implements multiple concepts
 - E.g., clusterbased routing

Outline

- 3 Algorithms
- 4 **Wiselib Distribution**
- 5 Exercises

Wiselib Demands

- Different demands: *Application Developer* and *Algorithm Developer*
- Application Developer
 - Integrate Wiselib in own applications
 - Use Wiselib algorithms Running on all supported platforms
 - Thoroughly tested
- Algorithm Developer
 - Integration of own implementations
 - May be tested only on available platform
 - May **not** be thoroughly tested
 - Add new concepts
 - Must be discussed with Wiselib contributors
 - May change due to iterative development process
- Solution: Distributions Stable, Testing, and Incubation

Distributions

- Incubation
 - Implementations for arbitrary architectures (e.g., Contiki)
 - Not required to use Wiselib API
 - Beneficial when porting an algorithm to Wiselib
 - `wiselib/trunk/wiselib.incubation`
- Testing
 - Implemented against Wiselib API
 - Algorithms may only be tested on some target platforms
 - New concepts that may change
 - Release Early, Release Often
 - `wiselib/trunk/wiselib.testing`
- Stable
 - Tested on all supported platforms
 - Concepts may not change anymore
 - `wiselib/trunk/wiselib.stable`

Outline

- 1 Basic Design Issues
 - Why is template based design so great?
 - Wiselib Basics
- 2 Architecture
 - OS Facets
 - Example Usage of Os Facets
 - Internal Interface
 - Message Delivery
- 3 Algorithms
- 4 Wiselib Distribution
- 5 Exercices

Exercise for this Session

- Write a simple flooding algorithm for the Wiselib.
 - Any node is able to send a message
 - That message should be sent to each node in the network
- The algorithm should implement the Routing Concept (concept given on next slide)
- Template for algorithm and message class is given
- Properties that the algorithm should have:
 - Get at least `Os` and `Radio` as template parameter
 - Do not send the same message twice
 - Reliability does not matter (do not care about message loss, unless you want to... :)
- Download sample files:
`http://www.ibr.cs.tu-bs.de/winterschool/session3-template.tgz`

Routing Concept

```

1| concept Routing
2| {
3|     typedef ... OsModel;
4|     typedef ... RoutingTable;
5|     typedef ... Radio;
6|     typedef ... Os;           ///< Can just be OsModel::Os
7|     typedef ... self_type;
8|     typedef ... node_id_t;
9|     typedef ... size_t;
10|    typedef ... block_data_t;
11|
12|    void enable( void );
13|    void disable( void );
14|
15|    void send( node_id_t receiver , size_t len , block_data_t *data );
16|
17|    template<class T, void (T::*TMethod)(node_id_t , size_t , block_data
18|        int reg_rcv_callback( T *obj_pnt );
19|    void unreg_rcv_callback( int idx );
20|
21|    void set_os( Os* os );
22|    Os* os();
23| };

```

Hints

- Use the provided Template
(here: *template* is meant as sample or draft)
- Note that the Flooding is derived from RoutingBase:
(un)reg_rcv_callback must **not** be implemented
- What should be done in enable:
 - Enable radio
 - Register at radio as receiver
- What should be done in disable:
 - Disable radio
 - Unregister at radio as receiver
